All comments from not fully vaccinated respondents

At this time I do not think it is necessary to get the vaccine for several reasons. The first reason is because the vaccine has not had enough time to see what the true long-term results are in humans. At this time no one can be sure of the true side effects of these new vaccines. As you know when creating a medical treatment there are several steps to follow before recommending a medical treatment to people. Once the side effects are known, people can be warned if they want to take this medical treatment. In short, I do not want to be part of the genetic treatment of these new vaccines. Second reason is that not all medical treatment is for everyone, since each body reacts differently to each medical treatment. Third is that I have been able to discover that my body is asymptomatic with the virus. Last year I got sick with the virus and had no symptoms in my body. So my body was able to develop natural antibodies for several months that protected me against the virus for more than 6 months. Fourth, As a result of being infected with the virus last year when there was no vaccine, I found an effective treatment that I used to fight the virus in my body. Thus, since all medical treatment is not for everything and each body reacts differently, I cannot suggest that my personal treatment is used for everyone to treat the virus. Thank God this treatment works for me and that is the most important thing. Fifth in an article published by the CDC has reported that vaccinated people can get sick with the virus. It also says that vaccinated and unvaccinated people can make other people sick with the virus. This means that the vaccine does not prevent the spread of the virus. However, this is not the case with natural antibodies developed once you have become ill with the virus. According to the doctors, after having suffered from the virus, the person is immune to the virus for more than 6 months. Therefore it cannot infect other people. Finally, I want to express that no one has the right to force anyone to take medical treatment. In my free right to decide, I decide not to be part of this genetic treatment of these new vaccines for the reasons I have mentioned above. I also want to wait for the time process that is carried out to find out what the true side effects of these new vaccines are to conclude. I hope that my decision not to be part of this genetic experiment with these new vaccines will affect my job

Thank you for the opportunity to explain! It has been incredibly stressful and alienating to be in the position of making the choice not to get the vaccination for right now. It is important for me to make it very clear that I am not an anti-vaxxer. I have spent the past 10 years of my life battling and healing a chronic illness. I have never had to share this because it has never once interfered with my ability to teach and to be a beloved and extremely passionate instructor. In fact, I have given all of my energy to my teaching and the illness itself has never gotten in the way of that. I have also come incredibly far in my healing in the past 3-4 years and feel stronger and healthier than ever. I take Covid very seriously and am still practicing extremely safe measures that include masking and quarantining. My choice to wait to be vaccinated is based on current CDC concerns and

I plan on getting the vaccine at the end of the semester. This is only so I don't fall behind on homework if I have an immune response to the vaccine like a fever or other symptoms. I am on immunosuppressive medication to treat a condition and I fear that I might end up having a bad reaction once receiving the vaccine so in order to avoid trying to catch up at homework I would rather wait.

yes, I am planning to get vaccinated

I will be speaking to my baby's pediatrician if he recommends I get vaccinated I will.

Yes, I'll get the first dose of Pfizer/Moderna

I wish I didn't have to

The MRNA I shot is an experimental gene therapy. At some point in the future when a critical mass of people wake up to this fact, you administration will have mountains of law suits on your desks.

No — I have natural immunity and antibodies after contracting and surviving COVID-19. And, even if I had not already had COVID, I will not be forced into injecting into my body a genetic-based therapy vaccine that has zero longitudinal studies of its long-term side-effects.
